

Engineered Coating Systems for the Built Environment

Armorize with AbShield™

GS – 500® Series Breathable Coatings

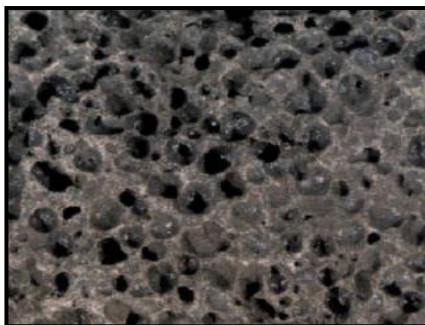

The GS-500 series coatings are part of AbShield™s "Blue Gill" technology, a new innovation in coatings designed for the building, industrial, automotive and marine industries.

Coatings that are breathable and durable with the ability to function as a polymeric filtration system, make AbShield's™ "Blue Gill" technology a functional alternative providing moisture-vapor management.

Similar to the gills of a fish filtering oxygen from water, our coating systems form polymeric matrices that breathe. They are designed to filter and neutralize specific gases and related odor molecules emitted from solid construction materials while providing flame retardancy and surface priming.

SI – 200® Series Powder Coatings

The SI-200 series coatings are a product of our engineered absorbent technology. The products work in confined or concealed spaces providing an absorbent layer designed to absorb and neutralize odor molecules and other airborne elements into the coating matrix.

With these powder coating systems there is no need to worry about coverage you cannot see. Two ounces of this product is enough to cover the surface area of 3 football fields on a molecular level. We have it covered.

To discover more about our coating systems, contact our Tech-Sales department on line. We will answer your questions and cover your projects.

"Superior Coatings. Superior Results."
